

## Why subscribe to a deployGuard.com™ service?

Q. Who is developing your web application?

Q. Did they use hashing to store passwords or credit card numbers in the back-end database?

**If the answer is “I don’t know” or “yes”, it is most likely they did not use strong encryption and your application will not pass a PCI audit.**

Q. Is your web application susceptible to malicious activity (Cross-site scripting or SQL Injection)

Q. Does your organization have the IT staff with the bandwidth and capability to ensure these and other vulnerabilities are not in your web applications.

**These vulnerabilities can make your company a target for Internet fraud and could cost your company millions of dollars a year in damages.**

Q. Does your SDLC process include metrics for tracking the quality of the web application software you receive from vendors?

Q. Do you have success criteria defined and the means to measure if your vendors are meeting the target criteria?

**A SDLC process with limited quality feedback to vendors will eventually cost your company more in change controls for re-work required to resolve quality issues.**

Q. Are your organizations web application support costs exponentially increasing because applications are constantly being developed with new technologies and not necessarily in the most modular or re-useable approach?

Q. Is your IT application architecture staff capturing metrics for code modularity and re-use?

**Code that is not modular can require excessive transition periods for on-boarding support resources.**

## Here is Why!

deployGuard.com™ is changing the future of developing reliable, secure, and compliant applications by offering a service for organizations to outsource the validity of web application software architecture, security, compliance, and quality. Our service includes automated workflow processes, various code and configuration scanners, an expert team of software architects, and a metric based scorecard providing the management and feedback required for a successful SDLC process.

Our team has decades of experience in defining, developing, testing, deploying, and supporting secure and reliable web applications. The deployGuard.com™ service allows us to share this experience and expertise with more organizations, more efficiently, and at a better price than any one-on-one consulting service.

We have a compelling service that we would like you to try. Please take a test drive of our service by registering for a free 30-day trial run at <http://www.deployguard.com>.
